Reviewing Camptothecin

Ke Chen

This quinoline based alkaloid was found in the bark of the Chinese camptotheca tree. Camptotheca goes by many names in China, including "happy tree", "dragon tree" and "fine tree". Chinese have used the "happy tree" in traditional medicine for thousands of years. It has been used for psoriasis, leukemia and diseases of liver, gallbladder, spleen, and stomach.

During the last half century, scientists have discovered its potential as a selective anticancer drug.

The unique mode of action for this potent cytotoxic compound was found to act via inhibition of an enzyme known as DNA topoisomerase I.

In Fig 1, normally, topoisomerases I introduces a nick in the DNA backbone allowing the rotation of one strand around another. This releases the torsional strain which otherwise accumulates in front of the advancing replication fork (the large arrow). The DNA break is extremely transient and is religated as it release the other strand.

In Fig 2, when camptothecin is present (black oval with C), it binds to the topoisomerase I nicked DNA complex. This prevents the religation of the nicked strand and the release of the enzyme. Eventually, the replication fork collides with the complex, causing the formation of a double-strand break.

Discovering Camptothecin

Monroe E. Wall (1916–2002)
Born in 1916 in Newark, NJ, Dr. Wall received his B.S., M.S., and Ph.D. degrees from Rutgers University. In 1941, he joined the United States Department of Agriculture. From 1941 to 1960, Dr. Wall gained national recognition as a government scientist in steroid chemistry. In 1960, Dr. Wall joined the Research Triangle Institute (RTI) to start a chemistry research group. He became RTI Vice President of Chemistry and Life Sciences in 1971. Among numerous contributions to the field of natural product research, he is best known for the discovery and development of taxol and camptothecin. In 1981 He retired from administration and devoted his time to research until two weeks before his death at 85.

Monroe Doctrine: “Get good people, support them with good facilities, do good science, work hard, and keep doing it.”

Mansukh C. Wani
Born in Nandurbar, India, Dr. Wani received his B.S. and M.S. degrees from the University of Bombay. He came to the United States and finished his Ph.D in chemistry at Indiana University under the instruction of Professor Ernest Campagn. After a postdoctoral fellowship at the University of Wisconsin-Madison, he accepted a position at RTI from Dr. Wall in 1962. Together they developed two of the most promising anticancer agents, taxol and camptothecin, which are benefiting millions of people all over the world. Dr. Wani is still active at RTI, supervising junior researchers.

Clinical trials started in the 1960s but were abandoned shortly thereafter.

1985 Determination of mechanism of action of camptothecin

After Camptothecin returned, like "the phoenix from the ashes", it rekindled interest in developing analogs of camptothecin that were both water soluble and retained anticancer activity

1996 FDA approval of two analogs of camptothecin for treatment of ovarian, lung, breast and colon cancer.

Some numbers and facts...

11729 publications regarding “camptothecin”.

114 publications involving total or formal synthesis of camptothecin and its derivatives.

By 2001, the analogs developed included Pharmacia’s Camptosar and GlaxoSmithKline’s Hycamtin, collectively reporting worldwide sales approaching $800 million.

Synthetic chemists embrace practility and perfection.
