Machine Learning

Deep Learning

- Classify

- Explain

- Predict

- Establish
Causality

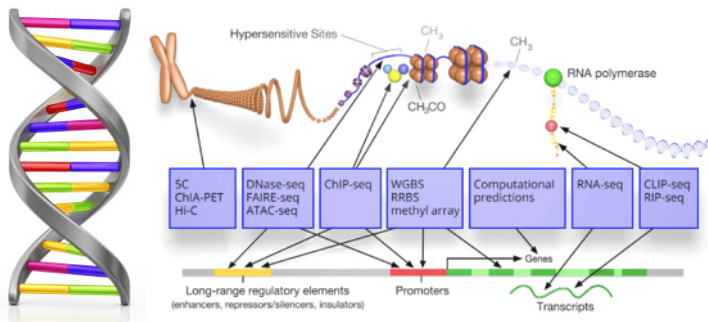

AI for genomics

- Human Genome 2001
- Encode project 2003
- GTEX 2008
- Nucleosome 3D genome ~2014

- Deep learning in genomics
 - Functional screens (CRISPR and parallel reporters)
- Large scale deep sequencing of the human population

~2015

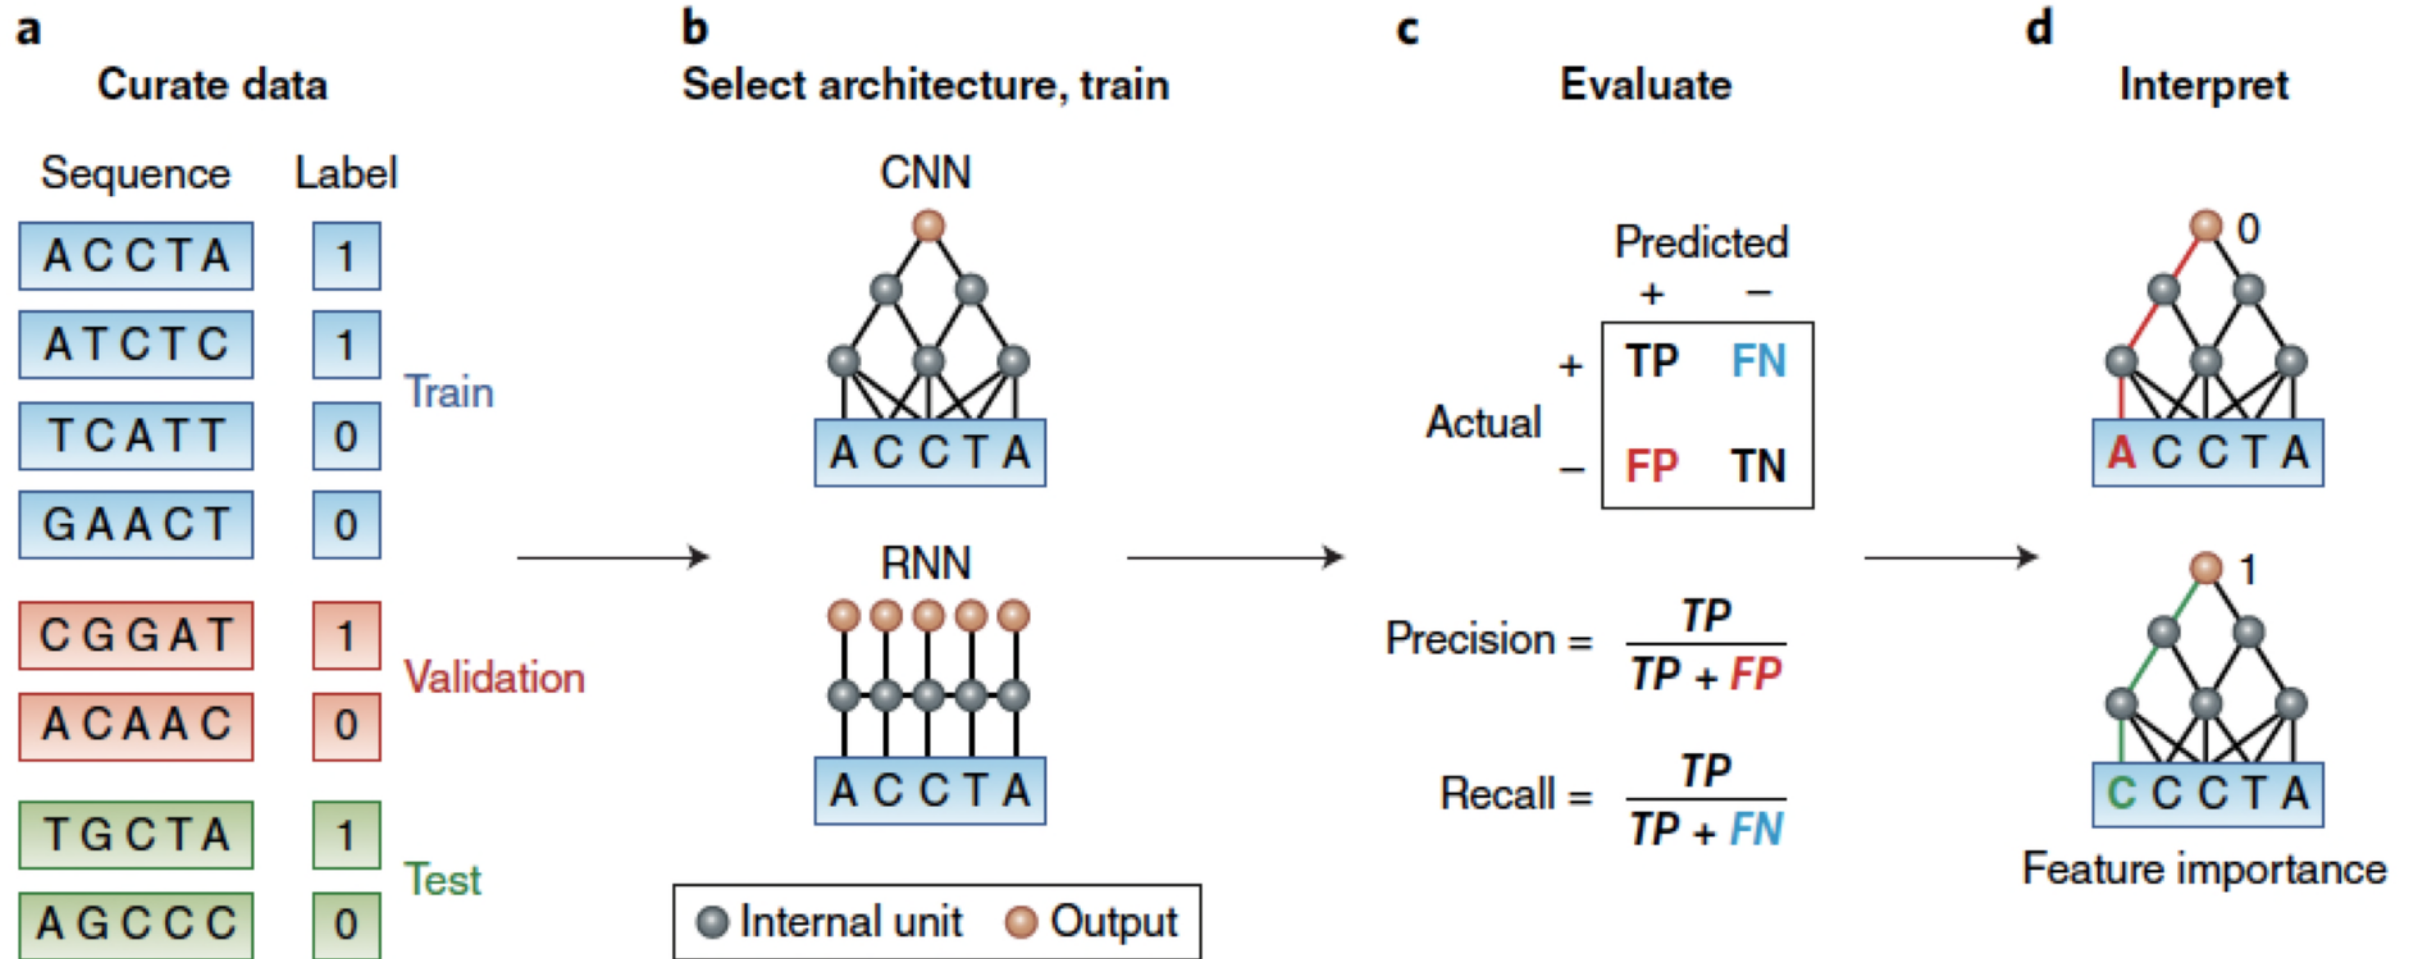

~2016

Deep sequencing of 10,000 human genomes

A primer on deep learning in genomics

A primer on deep learning in genomics

Two User Cases

Step 1 Model of Essentiality

Step 2 Functional screen and retraining

Machine Learning

Deep Learning

Machine learning model of non-coding genome essentiality

Machine learning model of non-coding genome essentiality

Test

20% of data

Generalization 1

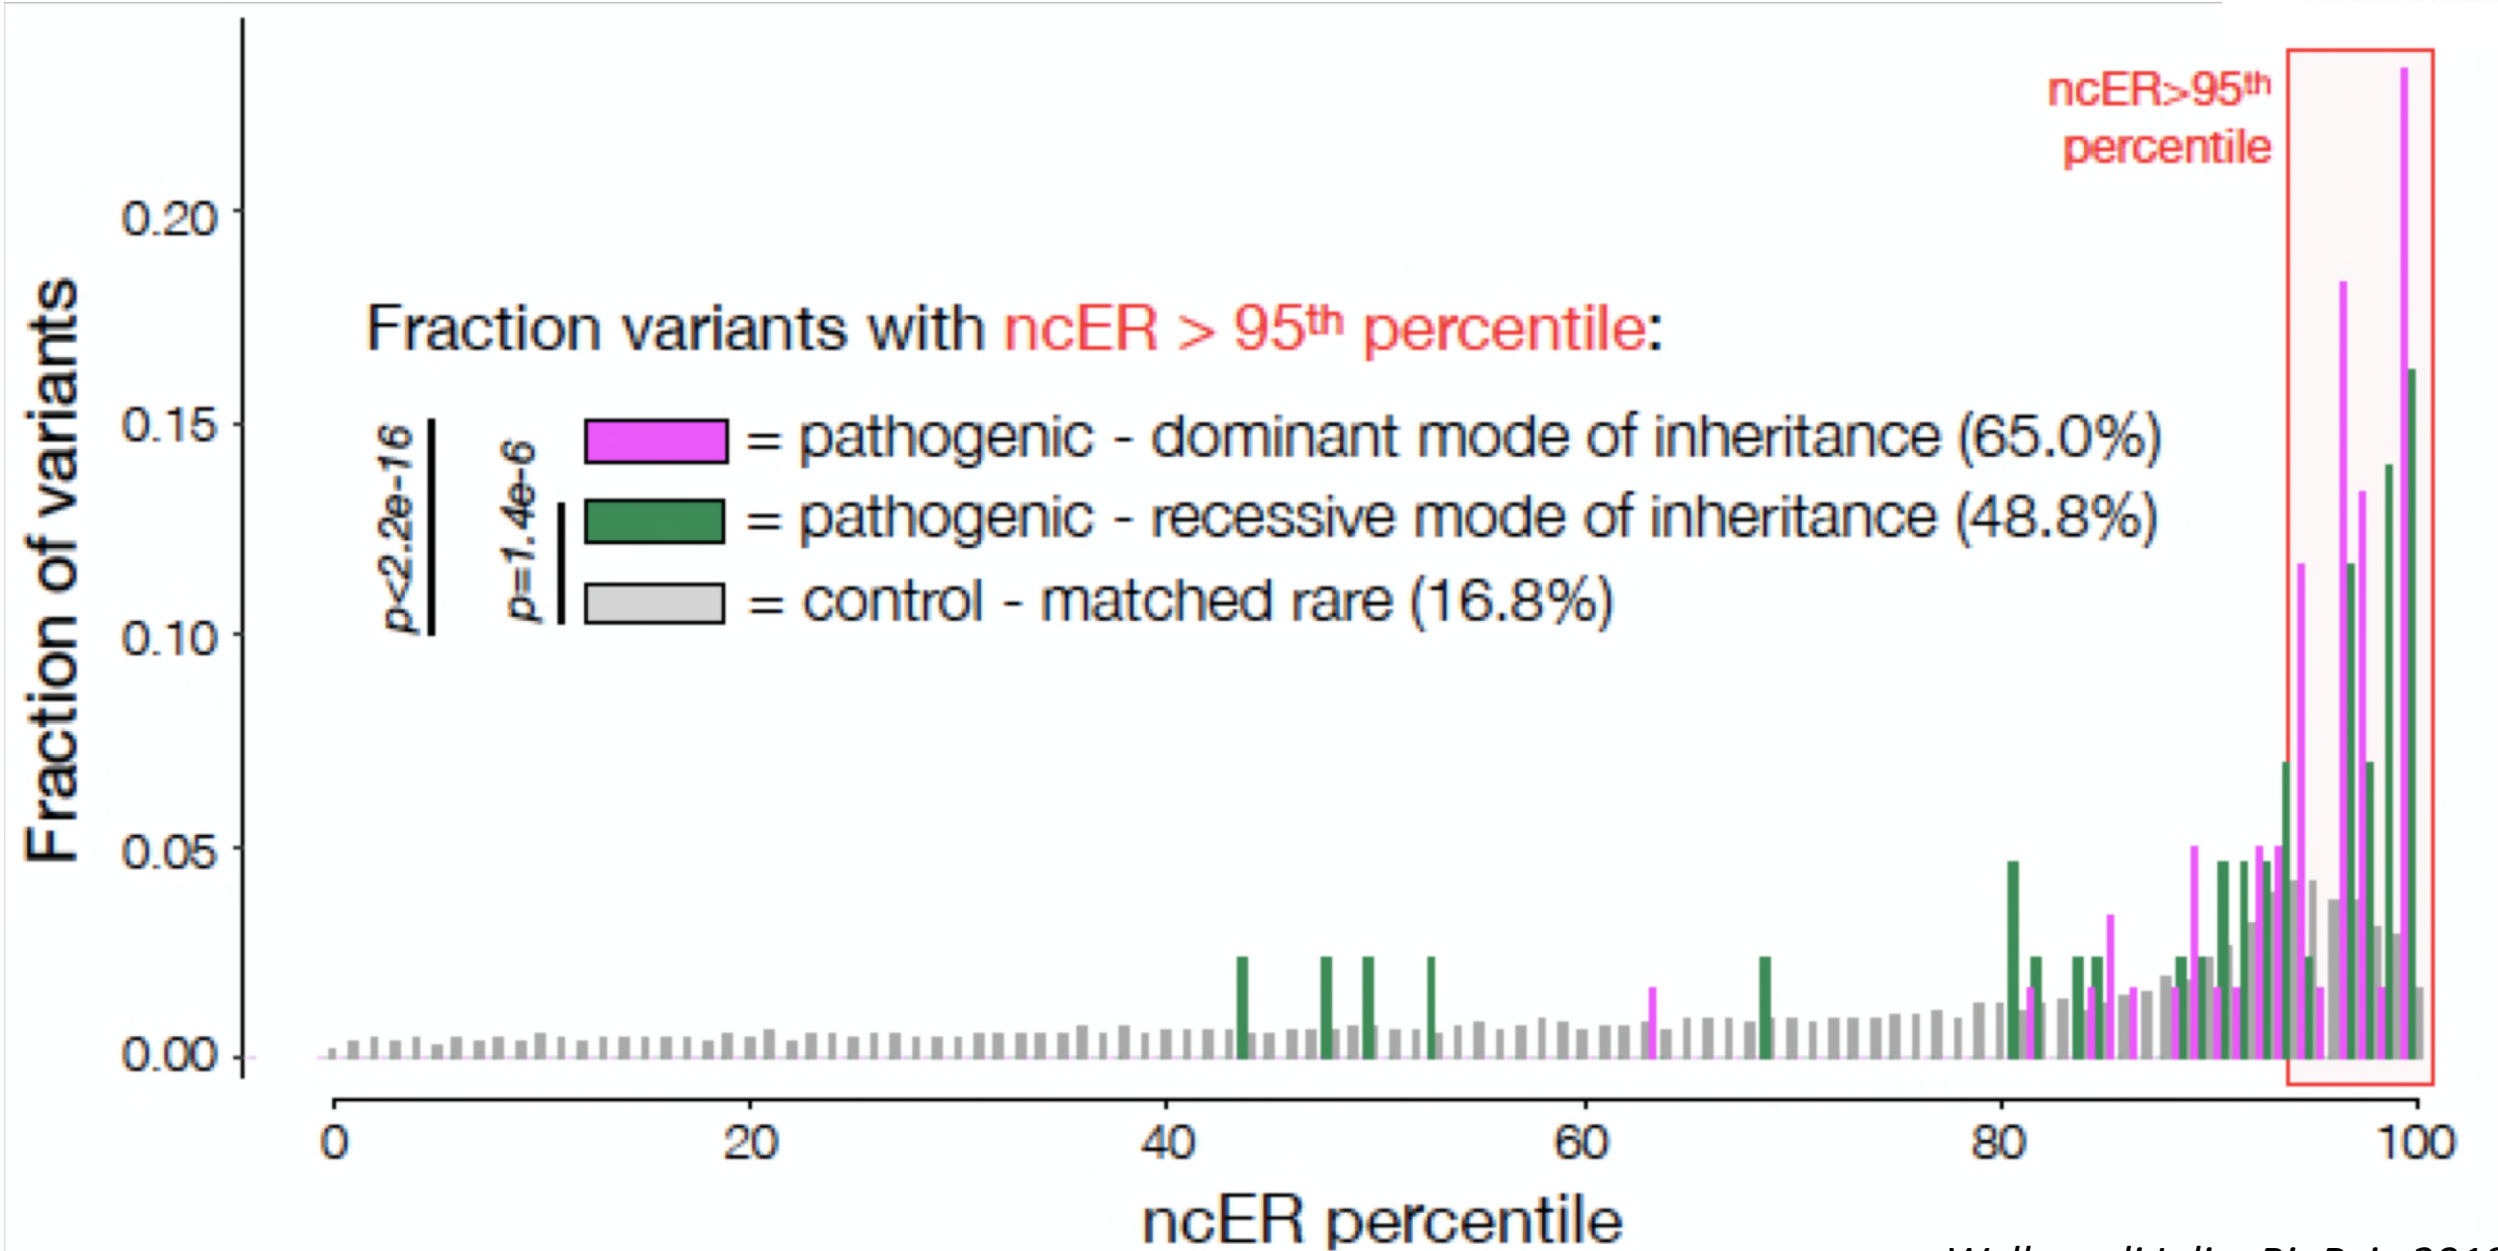

HGMD new set

Generalization 2

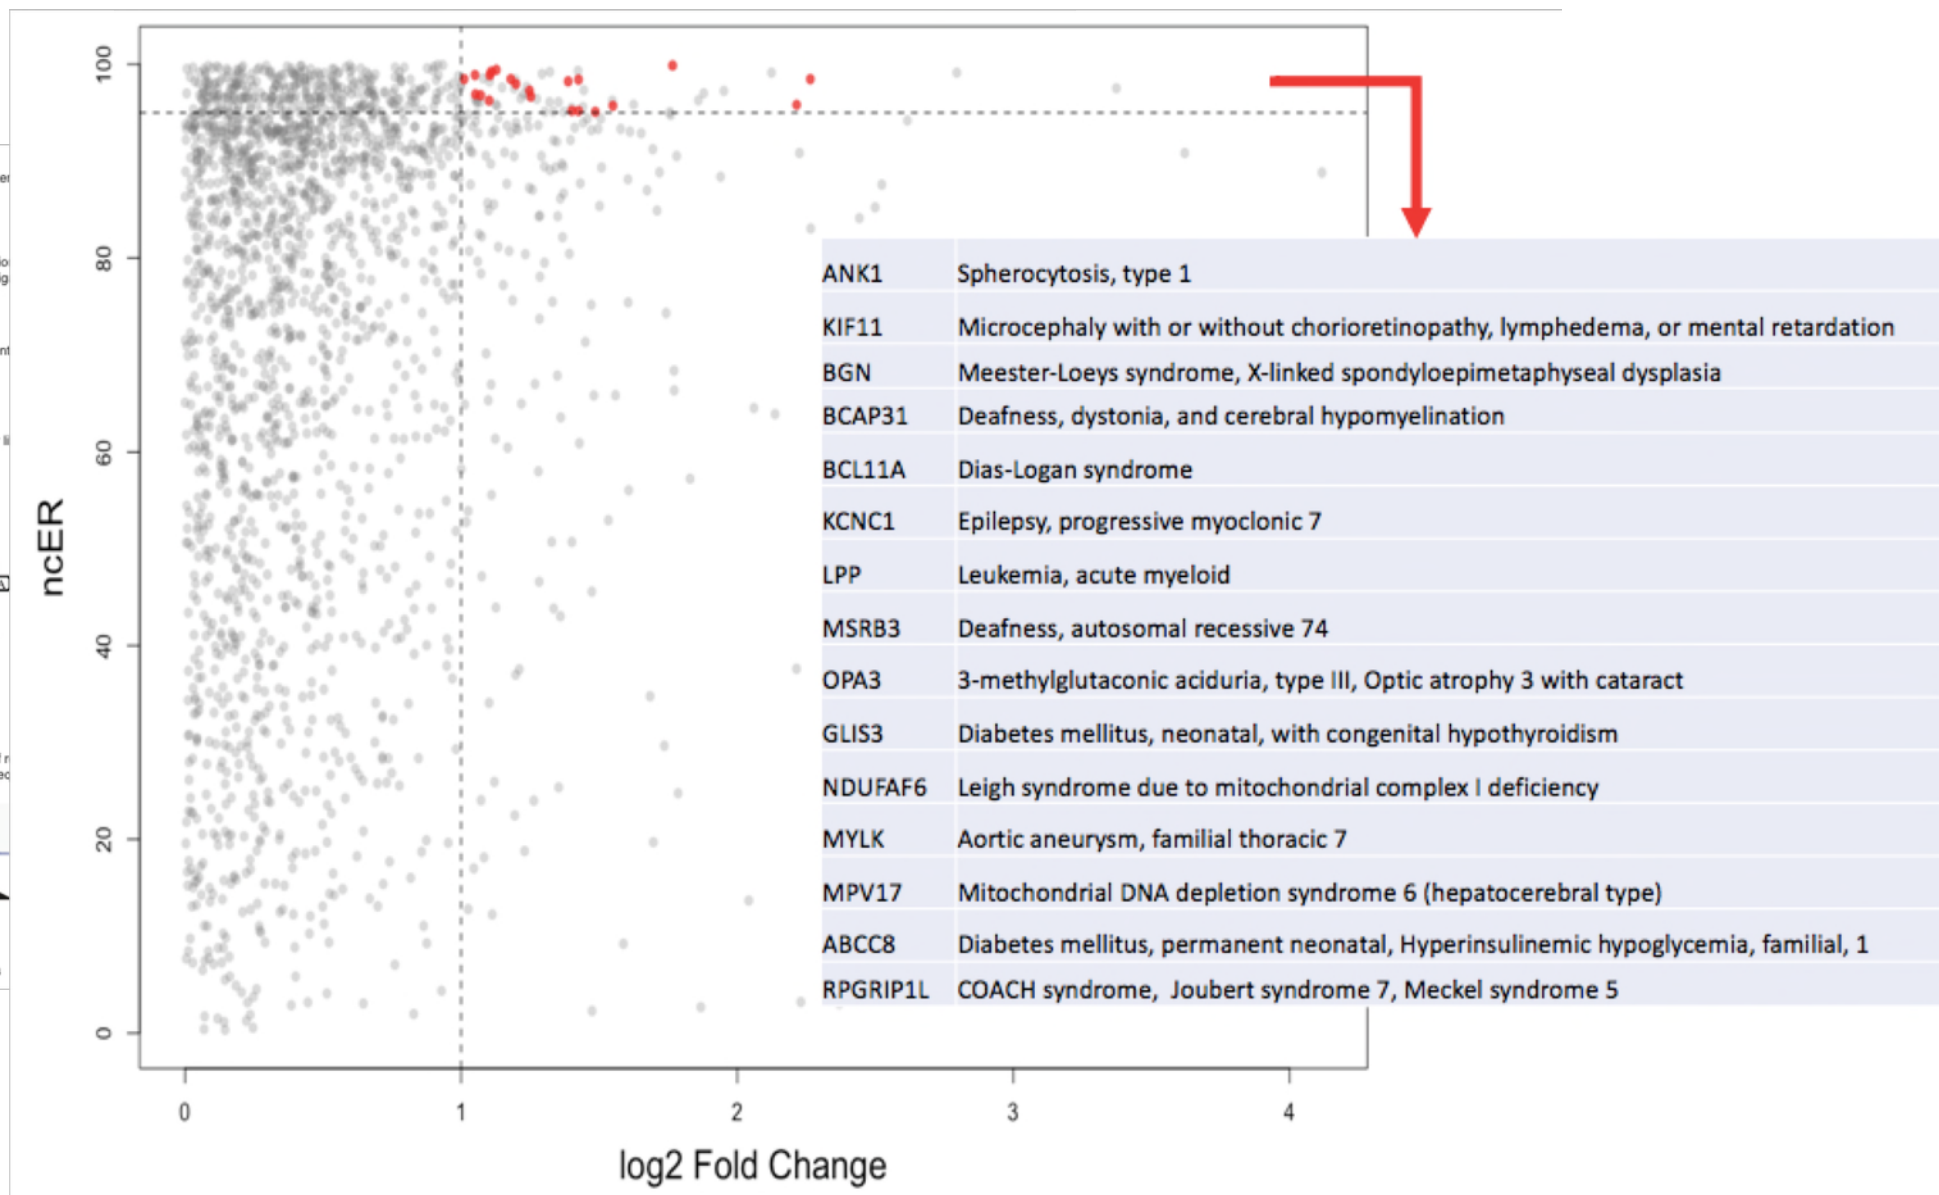

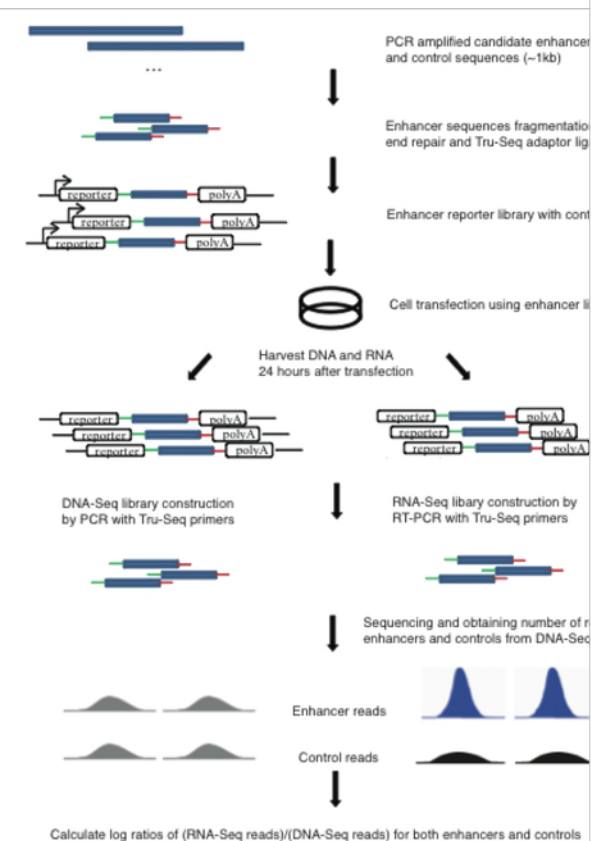

ncRNA pathogenic variants

Curated Mendelian non-coding variants

Identification of essential regulatory elements

Two User Cases

Step 1 Model of Essentiality

Step 2 Functional screen and retraining

Machine Learning

Deep Learning

Transfer learning

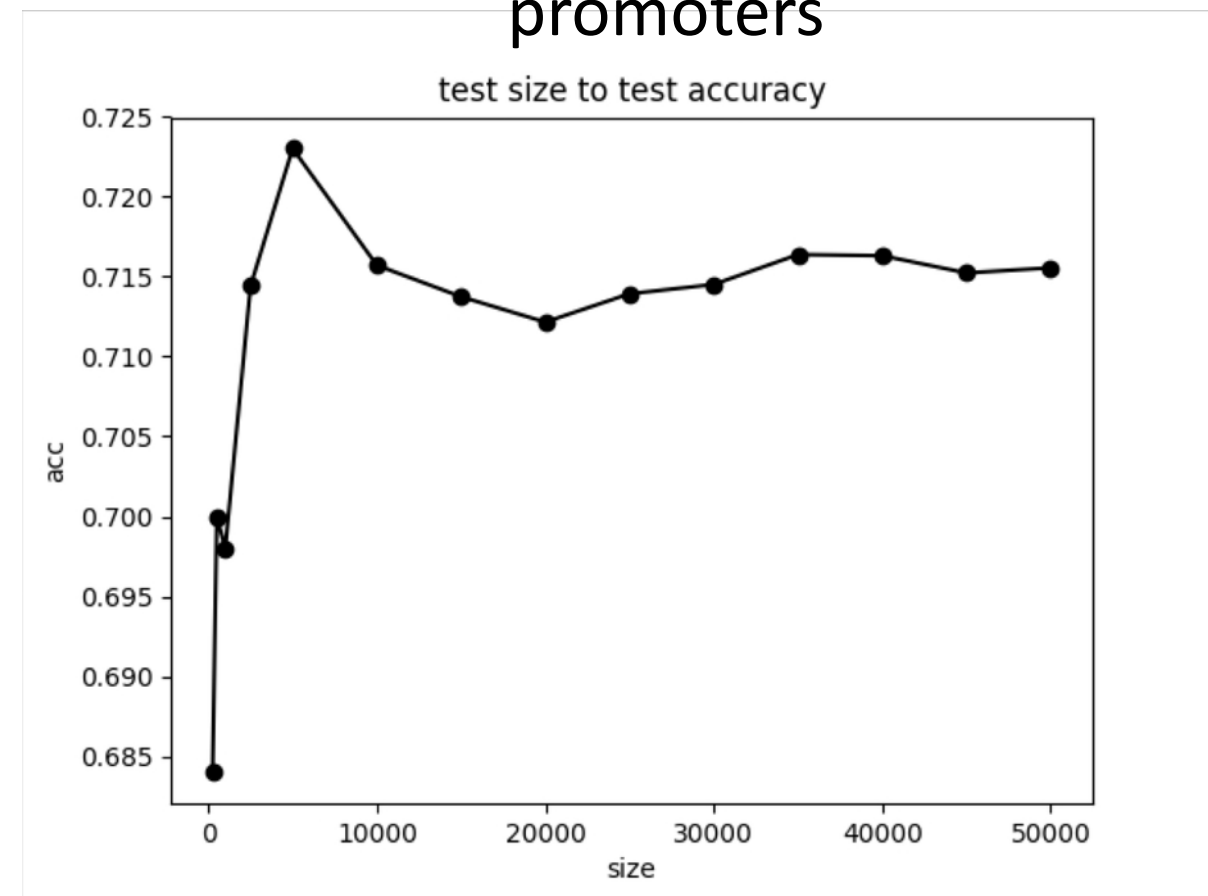

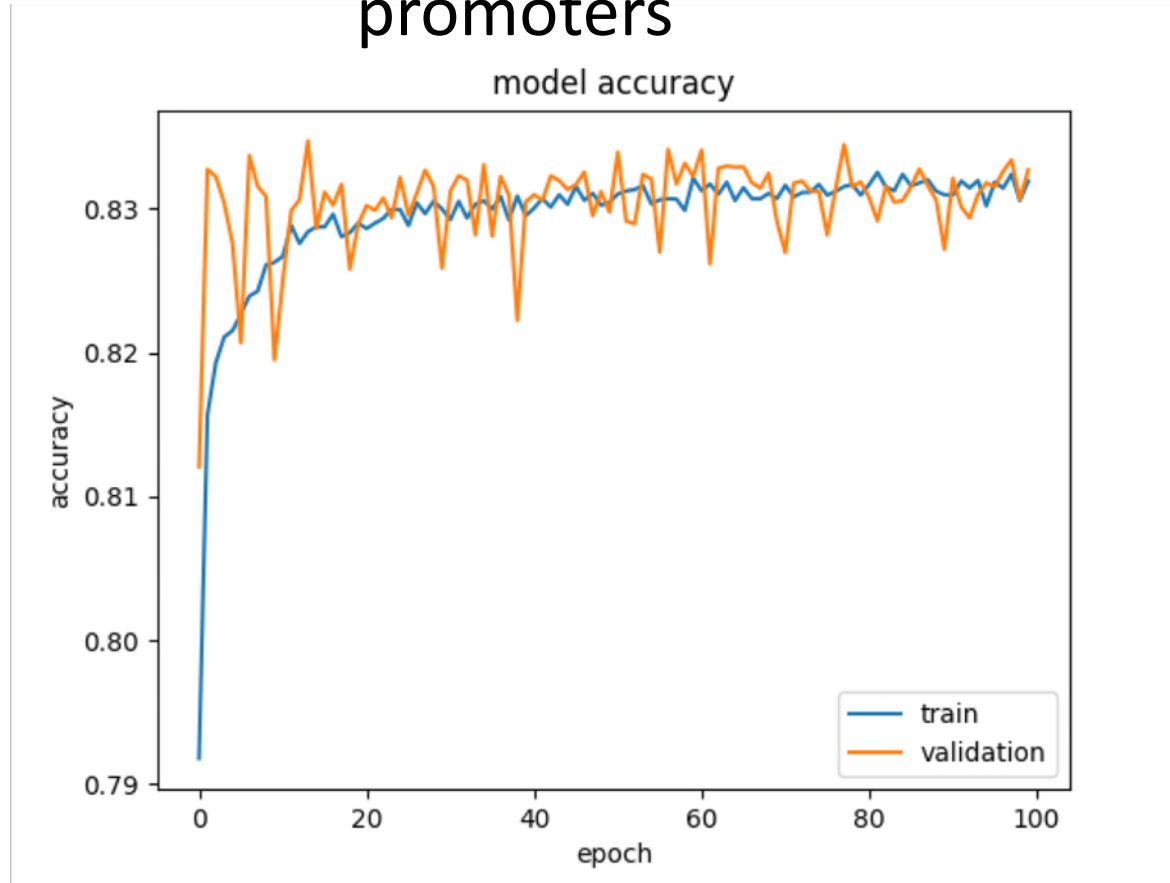

Training with
human
promoters

Deep Learning (CNN)

Transfer to
mouse
promoters

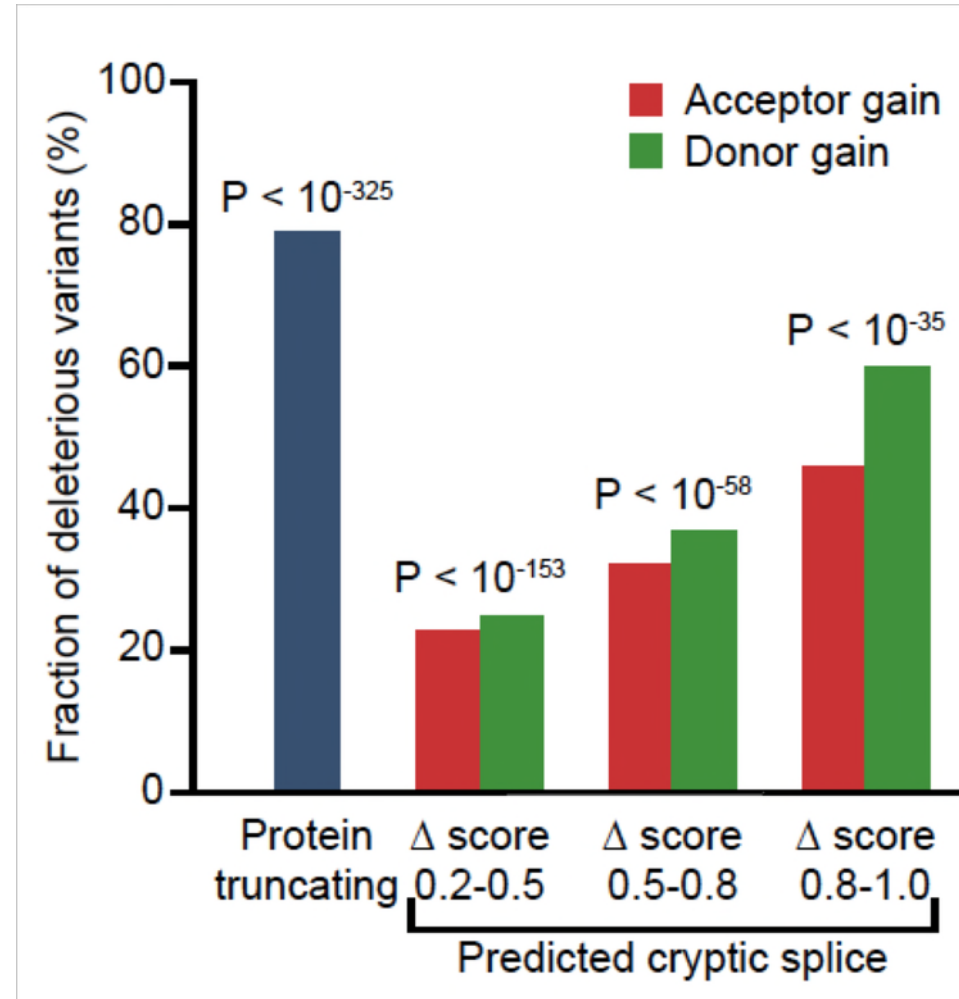

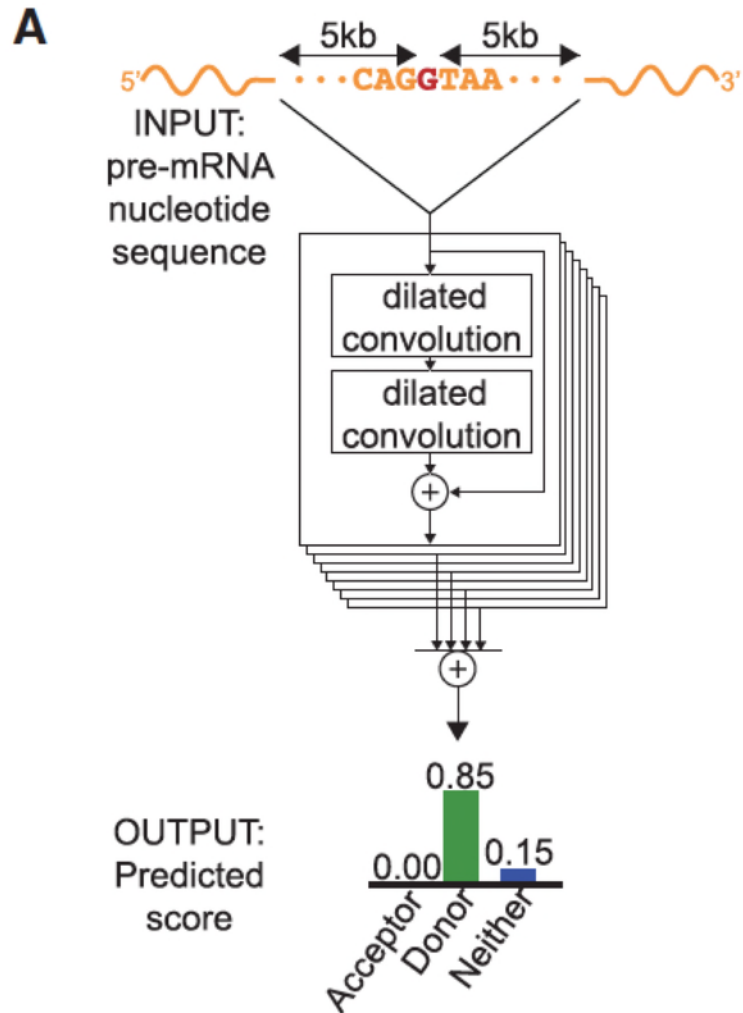

- Transfer learning from human to mouse and other mammals
- Goal is to provide alignment-free universal model for eukaryotic genomes

Notable progress

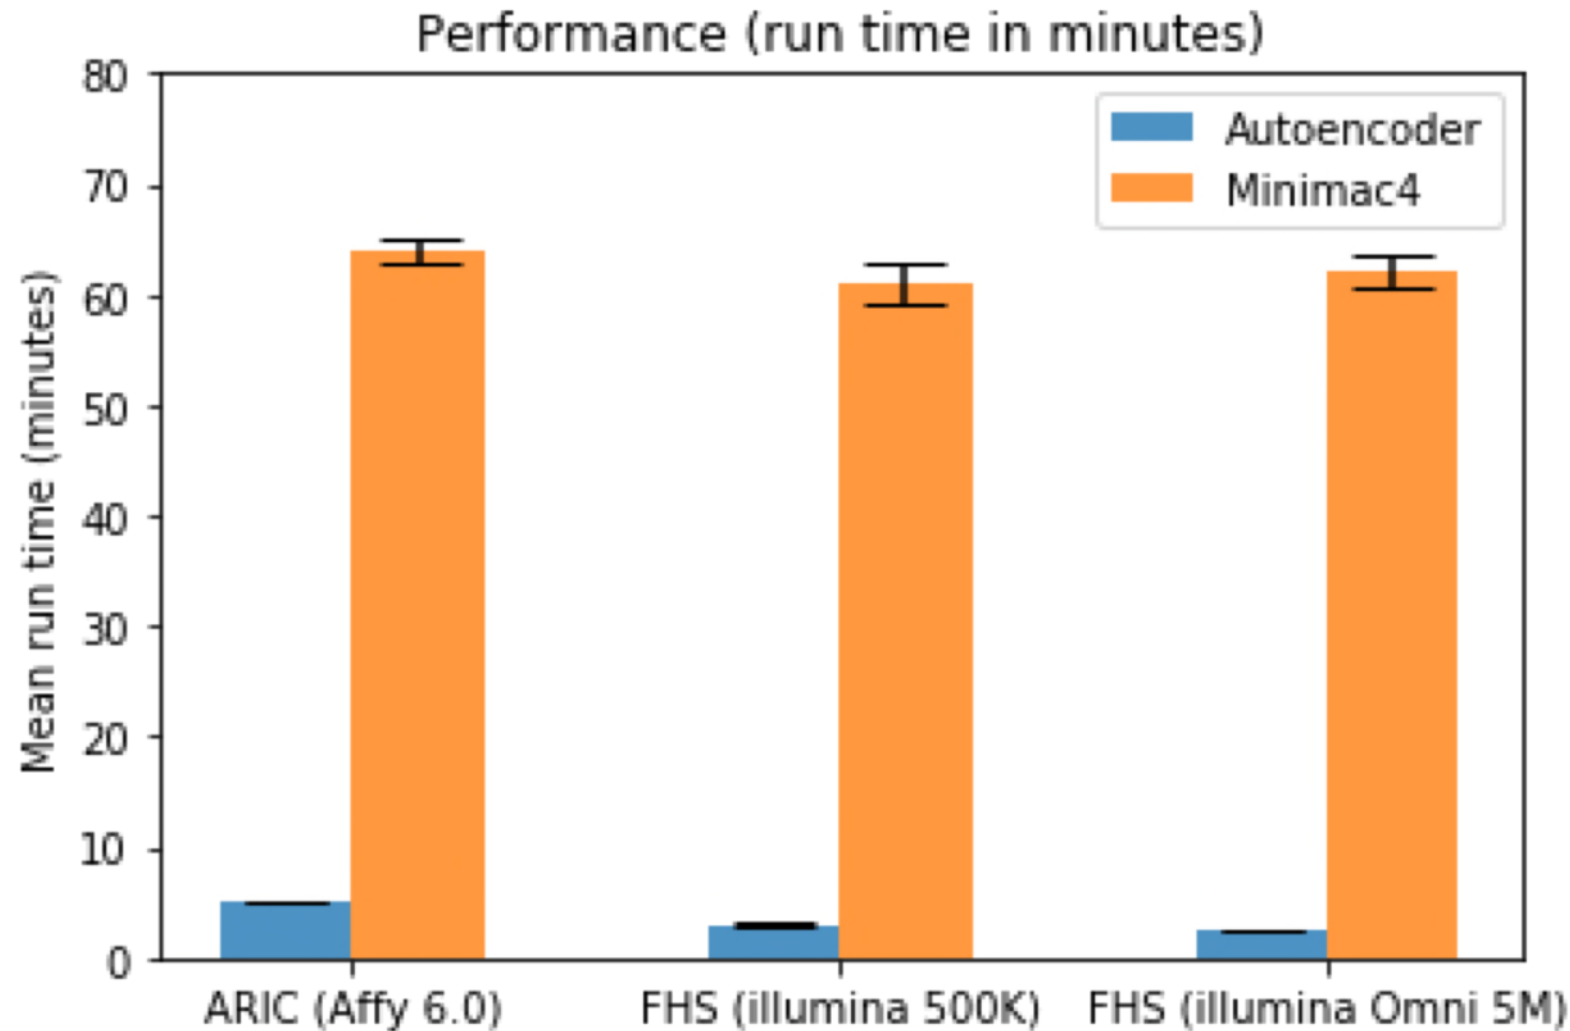

- New biology
- Better processivity of data

Predicting Splicing from Primary Sequence with Deep Learning

- A deep neural network models mRNA splicing
- Accurately predicts noncoding cryptic splice mutations
- Estimates that ~10% of pathogenic mutations in patients with rare genetic disorders are caused by this mechanism

Imputation run time: Deep learning approach versus common statistic methodology

Where to find the new AI genome-wide scores?

SUBSCRIBEWHAT IS NCER?ABOUT

please enter a rsid or chromosome position (e.g. rs333 or chr3:46414944)

Conclusions and perspectives

“Application of deep learning to genomic datasets is primed to revolutionize genome analysis” (Editorial Nat Genet 2019).

- How to design deep learning systems that support medical decisions (for example, genome interpretation)?
- How to avoid biases in training sets and how to interpret predictions?
- There is a need for iterative experimentation, in which deep learning predictions can be validated by functional laboratory tests or by formal clinical assessment.
